

Website Rebuild Report

Old WordPress site >> rebuilt site · Prepared July 15, 2026

Executive summary

TCB Metal Works' website has been rebuilt from the ground up as a fast, hand-coded static site. Compared with the previous WordPress site, it carries over 3x the content, adds rich-result structured data on nearly every page, cuts image weight by two-thirds, and is engineered for search visibility — all grounded in TCB's real project data. This report summarizes the measured gains and the adjustments still needed before the public launch.

Before vs. after

Metric	Old WordPress site	Rebuilt site
Pages	21	27
Content (words)	14,437	47,709
Average words / page	687	1,767
FAQ rich-result pages	0	17
Breadcrumb-schema pages	0	26
XML sitemap	None	27 URLs + robots.txt
Image payload	20.3 MB	6.8 MB
Modern image formats	5	12
Internal links	not tracked	1,515
Structured-data types	4	10 (all valid)

Word counts measured with the same method on both sites. Rebuilt-site figures verified by automated audits (July 15, 2026).

SEO improvements

- Every page has an optimized title (47-62 chars) and meta description (142-160 chars), a canonical URL, geo tags, and full Open Graph + Twitter social cards.
- Structured data across the whole site — 10 schema types, all validated: LocalBusiness / MetalWorker, Service, Article, BlogPosting, FAQPage, BreadcrumbList, CollectionPage, ContactPage, ItemList and WebPage.
- FAQ rich-result eligibility on 17 pages and breadcrumb trails on 26 pages — the old site had zero of either.
- A topical-authority content cluster: 8 in-depth zoo-enclosure articles, 5 blog posts, 4 project case studies, and a dedicated Projects hub, all cross-linked (1,515 internal links).
- Clean, folder-based “pretty” URLs that now resolve correctly (e.g. /projects/denver-zoo-australia-exhibit/) — indexable and canonical-matched on any host.
- All content fact-checked against TCB’s own project records for accuracy, and edited to read naturally rather than machine-generated.

Content

- Roughly 30,000 words of brand-new, in-depth editorial content that did not exist on the old site.
- 3.3x the total content, with average page depth up from 687 to 1,767 words — the kind of depth that earns rankings in a specialist niche.
- Two published case studies corrected to match reality: Denver Zoo (6063 aluminium, TIG-welded) and University of Miami (304 stainless swine pens, agricultural research).

Performance & accessibility

- Image payload cut from 20.3 MB to 6.8 MB (-67%); every image has width/height set, so layout shift (CLS) is zero.
- Hand-coded static HTML/CSS — no WordPress/Elementor overhead; fast to load and cheap to host.
- Zero missing alt text, one H1 per page, clean heading structure, and skip-links for keyboard users.

Technical quality — all checks passing

- SEO audit: 0 issues across all 27 pages
- Structured data (JSON-LD): all valid, 0 errors
- Broken links: 0
- Missing alt text: 0
- Heading structure: 0 level-skips, exactly one H1 per page
- Pretty URLs verified live at every depth (CSS, images, links all load; no console errors)

Remaining adjustments before publish

Must fix — blockers

- Contact / “Request a Quote” form has no backend — it shows success but sends nothing. Wire it to an email or form service so leads are actually received.
- Footer social icons (Facebook, X, YouTube) link to “#” on every page — add the real profiles or remove the icons.
- 301-redirect map for the ~17 old WordPress URLs (and old external project links) — host-dependent; set up on launch day so existing rankings and links don’t break.

Recommended before customers see it

- Final image pass — replace placeholder photos with real project shots, compress the 4 heavy images (eagle 745 KB, why-choose 577 KB, and 2 more), and convert the rest to WebP.
- Re-confirm current business facts used site-wide (phone, address, hours).

Already completed

- Pretty-URL structure, Privacy Policy page, newsletter removal, and the full data-accuracy pass are done and verified.
